Chitoshi Miki

Department of Civil Engineering  
Tokyo Institute of Technology

## Purpose of Inspection

In-service structures

Safety or not

NDE is the only method to inspect without damage to structures.

## Advantage of NDE

- Selection of appropriate repairing and retrofitting method
- Life prediction by fracture mechanics
- Periodic inspection schedule

## Types of NDE Methods

2 main types for different types of cracks

### Surface-breaking cracks

- VT : Visual Testing
- PT : Dye Penetrant Testing
- MT : Magnetic Particle Testing
- ET : Eddy Current Testing
- UT : Ultrasonic Testing

### Embedded cracks difficulty in detection because they are invisible!!

- UT : Ultrasonic Testing
- RT : Radiographic Testing

## Visual Test (VT)

Preliminary inspection of structures

# Magnetic Particle Test (MT)

## MT – Application at Sites

## Dye Penetrant Test (PT)

### Theory

1. Fill the penetrant on specimen surface

2. Clean specimen surface (eliminate excessive penetrant)

4. Penetrant leaks to film layer resulting in image of crack

3. Fill the film layer on specimen

## PT – Application at Sites

# Eddy Current Test (ET)

## Theory

If there is cracks or defects, signals will change

## ET – Application at Sites

# Radiographic Test (RT)

Transmit X-rays to a specimen and a film

# Ultrasonic Test (UT)

- Quality control of welds in shops
- Maintenance inspection in sites

## Types of probes

**Angle-beam probe:**  
45°, 60°, 65°, and 70°

## A-Scan:

Observe the flaw echo via CRT display

# UT – Application at Sites

## Manual UT (MUT)

## Automatic UT (AUT)

## Paint Films

Most of steel bridge members are coated with paint.  
Paint films prevent steel bridges from weathering corrosion.

How does it affect the inspection ?
