### 3 Cyclotomic Field

#### 3.1 Root of Unity

- $\zeta_n = e^{2\pi i/n} = \cos 2\pi/n + i \sin 2\pi/n$ .
- Cyclotomic field :  $\mathbb{Q}(\zeta_n)$ .
- If  $d|n$ , then  $\mathbb{Q}(\zeta_d) \subset \mathbb{Q}(\zeta_n)$ .
- Primitive root of unity :  $\zeta_n^m$  where  $(n, m) = 1$ . Then  $\mathbb{Q}(\zeta_n) = \mathbb{Q}(\zeta_n^m)$ .
- Euler function :  $\varphi(n) = \#\{m \in \mathbb{Z}; (n, m) = 1, 1 \leq m \leq n\}$

#### 3.2 Cyclotomic Polynomial

- The cyclotomic polynomial is a monic polynomial whose roots are primitive roots of unity :

$$\Phi_n(X) = \prod_{1 \leq m \leq n, (n, m) = 1} (X - \zeta_n^m).$$

- Then,

$$\prod_{d|n} \Phi_d(X) = X^n - 1,$$

and by Möbius inversion formula, we have

$$\Phi_n(X) = \prod_{d|n} (X^d - 1)^{\mu(n/d)}, \quad (1)$$

where  $\mu$  is the Möbius function defined for  $n = p_1^{e_1} p_2^{e_2} \cdots p_m^{e_m}$  by

$$\mu(n) = \begin{cases} 1 & \text{if } n = 1, \\ (-1)^m & \text{if } e_1 = e_2 = \cdots = e_m = 1, \\ 0 & \text{otherwise.} \end{cases}$$

Since the left hand side of (1) is polynomial, the denominator of the right hand side divides the numerator. Also the denominator is monic, it implies that  $\Phi_n(X)$  is a integer polynomial.

- **Example :**  $\Phi_6(X) = \frac{(X^6 - 1)(X - 1)}{(X^3 - 1)(X^2 - 1)} = X^2 - X + 1$

- **Theorem 3.2.1 :**  $\Phi_n(X)$  is irreducible over  $\mathbb{Q}$ . In particular,  $\text{Irr}_{\mathbb{Q}}(\zeta_n) = \Phi_n(X)$  and  $[\mathbb{Q}(\zeta_n) : \mathbb{Q}] = \varphi(n)$ .

To show this, we need two lemmas.

- **Lemma 3.2.2 :** Let  $p$  be a prime number and  $h(X)$  a polynomial with integer coefficients. Then

$$(h(X))^p \equiv h(X^p) \pmod{p}$$

*Proof.* Apply induction on the degree of  $h$ . If  $\deg h = 0$ , the assertion is nothing but the Fermat's little theorem. Suppose  $h = aX^m + g$  where  $\deg g < \deg h$ . Then

$$\begin{aligned} (h(X))^p &\equiv a^p X^{pm} + (g(X))^p \pmod{p} \\ &\equiv a(X^p)^m + g(X^p) \pmod{p} \\ &= h(X^p) \end{aligned}$$

and we are done. □

- **Lemma 3.2.3 :** Let  $p$  be a prime number and suppose that  $(n, p) = 1$ . Then,  $X^n - 1$  does not have a multiple root in  $\mathbb{F}_p$ .

*Proof.* Suppose that  $q$  is a root of  $X^n - 1 = 0$  over  $\mathbb{F}_p$ . Then  $q \not\equiv 0 \pmod{p}$  and we have

$$X^n - 1 \equiv (X - q)(X^{n-1} + qX^{n-2} + \cdots + q^{n-1}) \pmod{p}.$$

Substituting  $q$  in  $X$  in the right factor of the right hand side, and we obtain  $nq^{n-1} \not\equiv 0 \pmod{p}$  by the assumption. □

- **Proof of Theorem 3.2.1.** Let  $\zeta$  be a primitive  $n$ -th root of unity. Assume that  $\Phi_n(X) = g(X)h(X)$  and that  $g$  is irreducible and  $g(\zeta) = 0$ . Choose a prime  $p$  such that  $(p, n) = 1$ . Then since  $\Phi_n(\zeta^p) = 0$ , either  $g(\zeta^p) = 0$  or  $h(\zeta^p) = 0$ .

Suppose the later is the case. Then since  $h(X^p) = 0$  has a root  $x = \zeta$ ,  $h(X^p)$  is divisible by  $g(X)$  and hence  $h(X^p) = g(X)f(X)$ . By Lemma 3.2.2, the left hand side equals  $(h(X))^p \pmod{p}$  so that  $h(X)$  and  $g(X)$  have a common root in  $\mathbb{F}_p$ . Then since  $g(X)h(X) \equiv \Phi_n(X) \pmod{p}$ ,  $\Phi_n(X)$  has a multiple root in  $\mathbb{F}_p$ . On the other hand,  $\Phi_n(X)$  is a factor of  $X^n - 1$  over  $\mathbb{Q}$ , and  $X^n - 1$  does not have a multiple root in  $\mathbb{F}_p$  by Lemma 3.2.3, and hence so does  $\Phi_n(X)$  in  $\mathbb{F}_p$ . This is a contradiction,

and  $g(\zeta^p) = 0$ . In other word, we have shown that if a primitive root  $\zeta$  is a root of  $g(X)$ , then  $\zeta^p$  is also a root of  $g(X)$  provided that  $(n, p) = 1$ .

The rest done by induction since all primitive roots are obtained from  $\zeta_n$  by taking a prime power coprime to  $n$  successively.  $\square$

### 3.3 $\mathbb{Q}(\cos \frac{2m\pi}{n})$

- $\zeta_n^m + \zeta_n^{-m} = 2 \cos \frac{2m\pi}{n}$ .
- A candidate for the irreducible polynomial of  $\cos \frac{2m\pi}{n}$  over  $\mathbb{Q}$  :

$$\Psi_n(X) = \prod_{1 \leq m \leq n/2, (m, n)=1} \left( X - \cos \frac{2m\pi}{n} \right).$$

- **Theorem 3.3.1** : Let  $n = 3$  or  $n \geq 5$ ,  $m$  a positive integer such that  $(n, m) = 1$ . Then,  $\Psi_n(X)$  is irreducible over  $\mathbb{Q}$ . In particular,  $\text{Irr}_{\mathbb{Q}}(\cos \frac{2m\pi}{n}) = \Psi_n(X)$  and  $[\mathbb{Q}(\cos \frac{2m\pi}{n}) : \mathbb{Q}] = \varphi(n)/2$ .

*Proof.* Rewriting

$$\begin{aligned} \Phi_n(X) &= \prod_{1 \leq m \leq n/2, (n, m)=1} (X - \zeta_n^m)(X - \zeta_n^{-m}) \\ &= \prod_{1 \leq m \leq n/2, (n, m)=1} (X^2 - 2X \cos \frac{2m\pi}{n} + 1), \end{aligned}$$

we see that every fundamental symmetric polynomials of

$$\left\{ \cos \frac{2m\pi}{n} ; (n, m) = 1, 1 \leq m \leq n/2 \right\}$$

has value in  $\mathbb{Q}$ . Thus  $\Psi_n(X) \in \mathbb{Q}[X]$ .

Suppose  $\Psi_n(X)$  is not irreducible over  $\mathbb{Q}$ , then the factorization of  $\Psi_n(X)$  over  $\mathbb{Q}$  implies a factorization of  $\Phi_n(X)$  over  $\mathbb{Q}$ , which is a contradiction.  $\square$

### 3.4 Homework

1. Suppose  $n = p_1^{e_1} p_2^{e_2} \cdots p_m^{e_m}$ . Show

$$\varphi(n) = n \prod_j \left( 1 - \frac{1}{p_j} \right).$$

2. Compute  $\Phi_{105}(X)$ , and find degree of which 2 appears as a coefficient.
3. Show that if  $n$  is odd  $\geq 3$ , then  $\Phi_{2n}(X) = \Phi_n(-X)$
4. (1) Show  $\sqrt{-7} \in \mathbb{Q}(\zeta_7)$ .  
(2) Show  $\sqrt{13} \in \mathbb{Q}(\zeta_{13})$ .
5. Suppose  $p > 2$  is prime. Then  $\mathbb{Q}(\zeta_p)$  contains a real quadratic number field if and only if  $p \equiv 1 \pmod{4}$ .
6. Suppose  $n = 3$  or  $n \geq 5$ , and show that the constant term of  $\Psi_n(X)$  is
 
$$\begin{cases} 2^{-\varphi(n)/2}p & \text{if } n = 4p^e \geq 8 \text{ and } p \text{ prime,} \\ 2^{-\varphi(n)/2} & \text{otherwise.} \end{cases}$$
7. (1) Find the order of 2 in  $\mathbb{F}_{11}$ , and show that  $(X^{11} - 1)/(X - 1) \in \mathbb{F}_2[X]$  is irreducible.  
(2) Find the order of 2 in  $\mathbb{F}_{17}$ , and show that  $(X^{17} - 1)/(X - 1) \in \mathbb{F}_2[X]$  factors into the product of two polynomials of degree 8.
